## Chapter 3: Camera Tricks As an image editor, Photoshop's \_Canon RAW\_ ( \_CR2\_ ) file type has some unique features that make it valuable for photo editing. One of these unique features is the ability to edit the six major color channels and the exposure individually. When you open a CR2 file in Photoshop, you have the ability to work on each of the six color channels by their individual names. For example, if you want to edit Exposure and Brightness, you simply select that channel, and then you can change the exposure and brightness by using the Exposure and Brightness sliders. In contrast, when you open a JPEG image, you can only work with the default red, green, blue, and exposure adjustment channels, which are meant to mimic the way you view a regular color photograph. On a JPEG file, you cannot make adjustments for the green channel if you want to adjust the saturation of red tones. To adjust the red channel, you need to open the image in Photoshop and open the Red channel in the Channels dialog box. This chapter shows you how to easily open and work on each of the six color channels and the exposure in your CR2 files. It also shows you how to merge multiple RAW files, how to save edited files, and how to send edited files to a printer.

The beneficial effects are well documented as relating to the regulation of various physiological functions including inhibition of gastric acid secretion, increase in renal blood flow, inhibition of uterine contractions and reduction of inflammation in inflammatory bowel disease. In contrast, the prostaglandin PGF.sub.2.alpha. has been associated with gastric ulcers and with expelling the placenta during human pregnancy. The association of high levels of the prostaglandin PGF.sub.2.alpha. in plasma with gastric ulceration and premature delivery led to the introduction of therapy with prostaglandin synthetase inhibitors. Several classes of prostaglandin synthetase inhibitors have been developed and have been shown to ameliorate the symptoms of various diseases associated with elevated plasma levels of the prostaglandin PGF.sub.2.alpha. including preterm labor, intrauterine growth retardation, toxemia of pregnancy, and upper GI bleeding. The prostaglandin synthetase inhibitors are known to inhibit both cyclooxygenase (CO) and dehydrogenase reactions and are usually classified as belonging to one of the following categories: (1) arylacetic acids, (2) aromatic heterocyclic amines, and (3) indolealkylamines. Arylacetic acids are disclosed in U.S. Pat. Nos. 3,976,776, 3,976,777, and 3,977,
